# Mezhirov's game for intuitionistic logic and its variations 

Ivan Pyltsyn<br>qzh.ivan.pyltsyn@gmail.com<br>International Laboratory for Logic, Linguistics and Formal Philosophy HSE University, Moscow, Russia

STEP<br>2023

## Basic definitions (propositional case)

Let $\Omega$ be the propositional intuitionistic language with $\perp$ and the set of logical connectives $\{\rightarrow, \wedge, \vee\}$, where $\neg$ A will be considered as $A \rightarrow \perp$.

## Definition

For the set of formulas $\Gamma$ let $\mathcal{F}(\Gamma) \leftrightharpoons\{\psi \mid \psi$ is a subformula of some formula from $\Gamma$ \}.

## Definition

A position in the game $\mathcal{C} \leftrightharpoons\langle\mathcal{O}, \mathcal{P}\rangle$, where $\Gamma \subseteq \mathcal{O} \cup \mathcal{P} \subseteq \mathcal{F}(\Gamma)$ (in all our games will also be satisfied a condition $|\Gamma \cap \mathcal{P}|=1$ ).
A starting position is a $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}\right\rangle$, where $\Gamma=\mathcal{O}_{0} \cup\{\varphi\}$.

## Truth relation (propositional case)

## Definition

The truth relation $\Vdash$ for the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}\rangle$ and formulas from $\mathcal{F}(\Gamma)$ is defined recursively by the following rules:

```
\(\mathcal{C} \|+\)
\(\mathcal{C} \Vdash p \rightleftharpoons p \in \mathcal{O}\) for \(p \in \operatorname{Prop}\)
\(\mathcal{C} \Vdash \varphi \star \psi \rightleftharpoons \varphi \star \psi \in \mathcal{O} \cup \mathcal{P}\) and \((\mathcal{C} \Vdash \varphi) \star(\mathcal{C} \Vdash \psi)\) for \(\star \in\{\rightarrow, \wedge, \vee\}\)
```

## Order of turns

Let us call a formula from $\mathcal{P}$ Proponent's mistake if it is false in the current position (the same for $\mathcal{O}$ and Opponent). If Opponent has no mistakes but Proponent has, then Proponent moves. Otherwise, Opponent must move.

## Player's turn (propositional case)

During the turn
Proponent in his turn in the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}\rangle$ can expand $\mathcal{P}$ by adding one formula from $\mathcal{F}(\Gamma)$.
Opponent in his turn in the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}\rangle$ can expand $\mathcal{O}$ by adding one formula from $\mathcal{F}(\Gamma)$.

Conditions for winning
A player loses if he cannot make a move.

## Example 1 (propositional case)

$$
\begin{aligned}
& \Phi=(\neg q \rightarrow \neg p) \rightarrow(p \rightarrow q) \\
& \text { ant }=\neg q \rightarrow \neg p \\
& \text { con }=p \rightarrow q
\end{aligned}
$$

|  | Position 2 |  |  | Position 3 |  |  | Position 4 |  |  | Position 5 |  |  | Position 6 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathcal{O}$ | $\mathcal{P}$ | $1+$ | $\mathcal{O}$ | $\mathcal{P}$ | $\stackrel{1}{1}$ | $\mathcal{O}$ | $\mathcal{P}$ | $1+$ | $\mathcal{O}$ | $\mathcal{P}$ | $1+$ | $\mathcal{O}$ | $\mathcal{P}$ | $1-$ |
| Ф |  | $\times$ | 0 |  | $\times$ | 1 |  | $\times$ | 0 |  | $\times$ | 1 |  | $\times$ | 1 |
| ant | $\times$ |  | 1 | $\times$ |  | 1 | $\times$ |  | 1 | $\times$ |  | 0 | $\times$ |  | 1 |
| con |  |  | 0 |  | $\times$ | 1 |  | $\times$ | 0 |  | $\times$ | 0 |  | $\times$ | 1 |
| $\neg q$ |  |  | 0 |  |  | 0 |  |  | 0 |  | $\times$ | 1 |  | $\times$ | 0 |
| $\neg p$ |  |  | 0 |  |  | 0 |  |  | 0 |  |  | 0 |  |  | 0 |

## Example 2 (propositional case)

$$
\Phi=\neg \neg \neg p \rightarrow \neg p
$$

|  | Position 1 |  | Position 2 |  |  | Position 3 |  |  | Position 4 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathcal{O} \mathcal{P}$ | $1+$ | $\mathcal{O}$ | $\mathcal{P}$ | I- | $\mathcal{O}$ | $\mathcal{P}$ | $1+$ | $\mathcal{O}$ | $\mathcal{P}$ | $1-$ |
| Ф | $\times$ | 1 |  | $\times$ | 0 |  | $\times$ | 1 |  | $\times$ | 1 |
| $\neg \neg \neg p$ |  | 0 | $\times$ |  | 1 | $\times$ |  | 1 | $\times$ |  | 0 |
| $\neg \neg$ |  | 0 |  |  | 0 |  |  | 0 |  |  | 1 |
| $\neg \mathrm{p}$ |  | 0 |  |  | 0 |  | $\times$ | 1 |  | $\times$ | 0 |
| p |  | 0 |  |  | 0 |  |  | 0 | $\times$ |  | 1 |

## Main result (propositional case)

Theorem
Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}\right\rangle$ (with only finite $\mathcal{O}_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in propositional inuitionistic logic.

## Basic definitions

Let $\Sigma=\langle$ Pred, Const, arity $\rangle$ be our signature (without function symbols). Then let $\Omega$ be the elementary intuitionistic language of this signature; language will contain $\perp$, and the set of logical connectives will be $\{\rightarrow, \wedge, \vee\}$, where $\neg$ A will be considered as $\mathrm{A} \rightarrow$.

## Definition

For the set of formulas $\Gamma$ and set of objects (constants) $\Delta$ let $\mathcal{F}(\Gamma, \Delta) \leftrightharpoons\left\{\mathrm{P}\left[\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{n}}\right] \mid \mathrm{P}\left[\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right]\right.$ is a subformula of some formula from $\Gamma$ and free variables of it are only $\left.x_{1}, \ldots, x_{n} ; c_{i} \in \Delta\right\}$.

## Definition

A position in the game $\mathcal{C} \leftrightharpoons\langle\mathcal{O}, \mathcal{P}, \Delta, \Gamma\rangle$, where
$\Gamma \subseteq \mathcal{O} \cup \mathcal{P} \subseteq \mathcal{F}(\Gamma, \Delta)$ (in all our games will also be satisfied a condition $|\Gamma \cap \mathcal{P}|=1)$.
A starting position is a $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \Gamma\right\rangle$, where $\Gamma=\mathcal{O}_{0} \cup\{\varphi\}$ and $\Delta_{0}$ is an exact set of all constants contained in formulas from the set $\Gamma$.

## Truth relation

## Definition

The truth relation $\Vdash$ for the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}, \Delta, \Gamma\rangle$ and formulas from $\mathcal{F}(\Gamma, \Delta)$ is defined recursively by the following rules:

$$
\begin{aligned}
& \mathcal{C} \Vdash \perp \perp \\
& \mathcal{C} \Vdash \mathrm{A}\left[\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{n}}\right] \rightleftharpoons \mathrm{A}\left[\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{n}}\right] \in \mathcal{O} \text { for } \mathrm{A} \in \operatorname{Pred}, \operatorname{arity}(\mathrm{~A})=\mathrm{n}, \mathrm{c}_{\mathrm{i}} \in \Delta \\
& \mathcal{C} \Vdash \varphi \star \psi \rightleftharpoons \varphi \star \psi \in \mathcal{O} \cup \mathcal{P} \text { and }(\mathcal{C} \Vdash \varphi) \star(\mathcal{C} \Vdash \psi) \text { for } \star \in\{\rightarrow, \wedge, \vee\} \\
& \mathcal{C} \Vdash \mathrm{qxP}[\mathrm{x}] \rightleftharpoons \mathrm{qxP}[\mathrm{x}] \in \mathcal{O} \cup \mathcal{P} \text { and } \mathrm{q} \alpha \in \Delta(\mathcal{C} \Vdash \mathrm{P}[\alpha]) \text { for } \mathrm{q} \in\{\exists, \forall\}
\end{aligned}
$$

## Order of turns

Let us call a formula from $\mathcal{P}$ Proponent's mistake if it is false in the current position (the same for $\mathcal{O}$ and Opponent). If Opponent has no mistakes but Proponent has, then Proponent moves. Otherwise, Opponent must move.

## Player's turn

During the turn
Proponent in his turn in the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}, \Delta, \Gamma\rangle$ can expand $\mathcal{P}$ by adding formulas from $\mathcal{F}(\Gamma, \Delta)$.
Opponent in his turn in the position $\mathcal{C}=\langle\mathcal{O}, \mathcal{P}, \Delta, \Gamma\rangle$ can expand $\Delta$ by adding any new elements and also can expand $\mathcal{O}$ by adding formulas from $\mathcal{F}(\Gamma, \Delta)$.

## Conditions for winning

A player loses if he cannot pass turn to another player (so if he make a move twice in a row, he loses).
In an infinite game Proponent wins.

## Example 1

|  | $\mathcal{O}$ | $\mathcal{P}$ | $\Delta$ |
| :--- | :--- | :--- | :--- |
| 0 | $\varnothing$ | $\forall \mathrm{y} \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\mathrm{y}])$ | $\varnothing$ |
| 1 | $\varnothing$ | $\forall \mathrm{y} \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\mathrm{y}])$ | $\{\alpha\}$ |
| 2 | $\varnothing$ | $\forall \mathrm{y} \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\mathrm{y}]), \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\alpha]), \mathrm{P}[\alpha] \rightarrow \mathrm{P}[\alpha]$ | $\{\alpha\}$ |
| 3 | $\varnothing$ | $\forall \mathrm{y} \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\mathrm{y}]), \exists \mathrm{x}(\mathrm{P}[\mathrm{x}] \rightarrow \mathrm{P}[\alpha]), \mathrm{P}[\alpha] \rightarrow \mathrm{P}[\alpha]$ | $\{\alpha, \beta\}$ |

## Example 2

$$
\begin{aligned}
& \varphi=\forall x[(\mathrm{P}[\mathrm{x}] \rightarrow \forall x \mathrm{x}[\mathrm{x}]) \rightarrow \forall x \mathrm{x}[\mathrm{x}]] \rightarrow \forall \mathrm{xP}[\mathrm{x}] \\
& \psi[\mathrm{x}]=[(\mathrm{P}[\mathrm{x}] \rightarrow \forall \mathrm{xP}[\mathrm{x}]) \rightarrow \forall \mathrm{xP}[\mathrm{x}]] ;(\varphi=\forall \mathrm{x} \psi[\mathrm{x}] \rightarrow \forall \mathrm{xP}[\mathrm{x}])
\end{aligned}
$$

|  | $\mathcal{O}$ | $\mathcal{P}$ | $\Delta$ |
| :--- | :--- | :--- | :--- |
| 0 | $\varnothing$ | $\varphi$ | $\varnothing$ |
| 1 | $\forall \mathrm{x} \psi[\mathrm{x}]$ | $\varphi$ | $\varnothing$ |
| 2 | $\forall \mathrm{x} \psi[\mathrm{x}]$ | $\varphi, \forall \mathrm{xP}[\mathrm{x}]$ | $\varnothing$ |
| 3 | $\forall \mathrm{x} \psi[\mathrm{x}], \psi[\alpha]$ | $\varphi, \forall \mathrm{xP}[\mathrm{x}]$ | $\{\alpha\}$ |
| 4 | $\forall \mathrm{x} \psi[\mathrm{x}], \psi[\alpha]$ | $\varphi, \forall \mathrm{xP}[\mathrm{x}], \mathrm{P}[\alpha] \rightarrow \forall \mathrm{PP}[\mathrm{x}]$ | $\{\alpha\}$ |
| 5 | $\forall \mathrm{x} \psi[\mathrm{x}], \psi[\alpha], \mathrm{P}[\alpha], \psi[\beta]$ | $\varphi, \forall \mathrm{xP}[\mathrm{x}], \mathrm{P}[\alpha] \rightarrow \forall \mathrm{xP}[\mathrm{x}]$ | $\{\alpha, \beta\}$ |

## Main results

## Theorem

Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \mathcal{O}_{0} \cup\{\varphi\}\right\rangle$ (with possibly infinite $\mathcal{O}_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in logic of all Noetherian Kripke frames.

## Theorem

Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \mathcal{O}_{0} \cup\{\varphi\}\right\rangle$ (with only finite $\mathcal{O}_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in logic of all Casari's Kripke frames (class of all Kripke frames in which Casari's formula $\varphi=\forall x[(\mathrm{P}[\mathrm{x}] \rightarrow \forall \mathrm{xP}[\mathrm{x}]) \rightarrow \forall \mathrm{xP}[\mathrm{x}]] \rightarrow \forall \mathrm{xP}[\mathrm{x}]$ is valid; Kripke frame is from Casari's class iff in every countable sequence of worlds $\omega_{\mathrm{i}}$ their individual domains $\Delta_{\mathrm{i}}$ remain finite and stabilize).

## Theorem

In the finite variation, Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\{\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \mathcal{O}_{0} \cup\{\varphi\}\right\rangle$ (with possibly infinite $\mathcal{O}_{0}$, but with only finite $\Delta_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in logic of all Noetherian Kripke frames with only finite individual domains $\Delta$ in each world.

## Theorem

In the finite variation, Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \mathcal{O}_{0} \cup\{\varphi\}\right\rangle$ (with only finite $\mathcal{O}_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in logic of all Casari's Kripke frames with only finite individual domains $\Delta$ in each world.

## Theorem

In the finite variation, Proponent has a winning strategy in position $\mathcal{C}_{0}=\left\langle\mathcal{O}_{0},\{\varphi\}, \Delta_{0}, \mathcal{O}_{0} \cup\{\varphi\}\right\rangle$ (with only finite $\mathcal{O}_{0}$ ) iff $\mathcal{O}_{0} \vDash \varphi$, where $\vDash$ is the entailment in logic of all finite Kripke frames with only finite individual domains $\Delta$ in each world.
